

Higher Order ODEs

1 Linear ODEs

1.1 General Theory

Theorem 1.1 (Existence and Uniqueness Theorem).

Let $I \subseteq \mathbb{R}$ be an open interval and suppose functions $g, p_0, p_1, \dots, p_{n-1}$ are continuous on I . Then for $t_0 \in I$ and real numbers $y_0, y_1, \dots, y_{n-1}$, there exists exactly one solution to the IVP

$$\begin{aligned} y^{(n)} + p_{n-1}(t)y^{(n-1)} + \dots + p_1(t)y' + p_0(t)y &= g(t), \\ y(t_0) = y_0, \quad y'(t_0) = y_1, \quad \dots, \quad y^{(n-1)}(t_0) &= y_{n-1}. \end{aligned}$$

Theorem 1.2 (Principle of Superposition).

If $y_1, y_2, \dots, y_n$ are solutions to the homogeneous linear ODE

$$y^{(n)} + p_{n-1}(t)y^{(n-1)} + \dots + p_1(t)y' + p_0(t)y = 0,$$

then any linear combination

$$y = c_1y_1 + c_2y_2 + \dots + c_ny_n,$$

where $c_1, c_2, \dots, c_n$ are constants, is also a solution to the homogeneous equation.

Definition 1.1 (Wronskian).

The Wronskian of n functions $y_1, y_2, \dots, y_n$ is defined as the determinant

$$W(y_1, y_2, \dots, y_n)(t) = \begin{vmatrix} y_1(t) & y_2(t) & \dots & y_n(t) \\ y_1'(t) & y_2'(t) & \dots & y_n'(t) \\ \vdots & \vdots & \ddots & \vdots \\ y_1^{(n-1)}(t) & y_2^{(n-1)}(t) & \dots & y_n^{(n-1)}(t) \end{vmatrix}.$$

Definition 1.2 (Fundamental Set of Solutions).

The set of n solutions $y_1, y_2, \dots, y_n$ to an n -th order homogeneous linear ODE defined on an interval I is called a **fundamental set of solutions (FSS)** if every solution to the homogeneous equation can be expressed as a linear combination of $y_1, y_2, \dots, y_n$.

Theorem 1.3.

If $p_0, \dots, p_{n-1}$ are continuous on an interval I and $y_1, \dots, y_n$ are solutions to the homogeneous linear ODE

$$y^{(n)} + p_{n-1}(t)y^{(n-1)} + \dots + p_1(t)y' + p_0(t)y = 0,$$

then every solution to the ODE can be expressed as a linear combination of $y_1, \dots, y_n$ if and only if

$$\exists t \in I \text{ s.t. } W(y_1, \dots, y_n)(t) \neq 0$$

Theorem 1.4.

Let $y_1, \dots, y_n$ be the solutions to the homogeneous linear ODE

$$y^{(n)} + p_{n-1}(t)y^{(n-1)} + \dots + p_1(t)y' + p_0(t)y = 0, \quad \text{for } t \in I.$$

Then

$$y_1, \dots, y_n \text{ are linearly independent} \iff \exists t \in I \text{ s.t. } W(y_1, \dots, y_n)(t) \neq 0.$$

Theorem 1.5 (Abel's Theorem).

If $y_1, \dots, y_n$ are solutions to the homogeneous linear ODE

$$y^{(n)} + p_{n-1}(t)y^{(n-1)} + p_{n-2}(t)y^{(n-2)} + \dots + p_1(t)y' + p_0(t)y = 0, \quad \text{for } t \in I,$$

then the Wronskian is given by

$$W(y_1, \dots, y_n)(t) = c \cdot \exp\left(-\int p_{n-1}(t) dt\right) \quad \text{where } c \text{ is a constant depending on } y_1, \dots, y_n.$$

1.2 Homogeneous Equations with Constant Coefficients

For constants $a_n \neq 0, a_{n-1}, \dots, a_1, a_0 \in \mathbb{R}$,

$$a_n y^{(n)} + a_{n-1} y^{(n-1)} + \dots + a_1 y' + a_0 y = 0$$

Characteristic polynomial:

$$\begin{aligned} Z(r) &= a_n r^n + a_{n-1} r^{n-1} + \dots + a_1 r + a_0 \\ &= a_n (r - r_1)(r - r_2) \dots (r - r_n) \\ &= a_n (r - r_1)^{m_1} (r - r_2)^{m_2} \dots (r - r_k)^{m_k} \end{aligned}$$

where $r_1, r_2, \dots, r_n \in \mathbb{C}$ are the roots of $Z(r)$.

Complex-valued solutions

Complex roots must appear in conjugate pairs, i.e., if $r = \lambda + i\mu$ is a root, then its conjugate $\bar{r} = \lambda - i\mu$ is also a root. The complex-valued solution pair $y = e^{(\lambda+i\mu)t}$ and $y = e^{(\lambda-i\mu)t}$ can be re-expressed as the real-valued solution pair:

$$y = e^{\lambda t} \cos(\mu t) \quad \text{and} \quad y = e^{\lambda t} \sin(\mu t).$$

1.3 Non-Homogeneous Equations

$$a_n y^{(n)} + a_{n-1} y^{(n-1)} + \dots + a_1 y' + a_0 y = g(t)$$

Then the general solution is given by

$$y(t) = y_c(t) + y_p(t),$$

where y_c is the complementary solution (homogeneous solution) and y_p is a particular solution.

1.4 Method of Undetermined Coefficients

1.5 Variation of Parameters

Theorem 1.6 (Variation of Parameters).

Suppose $g, p_0, \dots, p_{n-1}$ are continuous on an interval I . Then a particular solution to the non-homogeneous linear ODE

$$y^{(n)} + p_{n-1}(t)y^{(n-1)} + \dots + p_1(t)y' + p_0(t)y = g(t)$$

can be found by

$$y_p(t) = u_1(t)y_1(t) + u_2(t)y_2(t) + \dots + u_n(t)y_n(t)$$

where $y_1, y_2, \dots, y_n$ is a FSS to the corresponding homogeneous equation and $u_1, u_2, \dots, u_n$ are functions given by

$$u_i(t) = \int \frac{g(t) \cdot \det[M_i(t)]}{W(y_1, \dots, y_n)(t)} dt, \quad \text{for } i = 1, 2, \dots, n, \quad \text{and}$$

$$M_i = \begin{pmatrix} y_1 & \dots & y_{i-1} & 0 & y_{i+1} & \dots & y_n \\ y_1' & \dots & y_{i-1}' & 0 & y_{i+1}' & \dots & y_n' \\ \vdots & \ddots & \vdots & \vdots & \vdots & \ddots & \vdots \\ y_1^{(n-1)} & \dots & y_{i-1}^{(n-1)} & 1 & y_{i+1}^{(n-1)} & \dots & y_n^{(n-1)} \end{pmatrix}.$$

Let $u_1, u_2, \dots, u_n$ be functions satisfying the system of equations

$$\begin{pmatrix} y_1 & y_2 & \cdots & y_n \\ y'_1 & y'_2 & \cdots & y'_n \\ \vdots & \vdots & \ddots & \vdots \\ y_1^{(n-2)} & y_2^{(n-2)} & \cdots & y_n^{(n-2)} \\ y_1^{(n-1)} & y_2^{(n-1)} & \cdots & y_n^{(n-1)} \end{pmatrix} \begin{pmatrix} u'_1 \\ u'_2 \\ \vdots \\ u'_{n-1} \\ u'_n \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ \vdots \\ 0 \\ g(t) \end{pmatrix}$$

Then it can be verified that $y_p = u_1 y_1 + \cdots + u_n y_n$ is a particular solution to the non-homogeneous equation.

2 First order ODE systems

The general system of first order equations involving n dependent variables defined on an interval $I \subseteq \mathbb{R}$ can be written as

$$\begin{cases} y'_1(t) = F_1(t, y_1, \dots, y_n) \\ y'_2(t) = F_2(t, y_1, \dots, y_n) \\ \vdots \\ y'_n(t) = F_n(t, y_1, \dots, y_n) \end{cases} \quad \text{for } t \in I. \quad (1)$$

with initial conditions $y_1(t_0) = x_1, y_2(t_0) = x_2, \dots, y_n(t_0) = x_n,$

The solution to the system can be expressed in vector form as

$$\mathbf{y}(t) = \begin{pmatrix} y_1(t) \\ y_2(t) \\ \vdots \\ y_n(t) \end{pmatrix}$$

Theorem 2.1 (Existence and Uniqueness).

For the system of first order ODEs (1), if the functions $F_1, F_2, \dots, F_n$ and the partial derivatives $\frac{\partial F_i}{\partial y_j}$ for all pairs $i, j = 1, 2, \dots, n$ are continuous on a region R defined by

$$R := [t_0 - a, t_0 + a] \times [x_1 - b, x_1 + b] \times \cdots \times [x_n - b, x_n + b] \subseteq \mathbb{R}^{n+1},$$

where constants $a, b > 0$, then there exists a unique solution $\mathbf{y}(t)$ for $t \in (t_0 - h, t_0 + h)$ to the IVP, where

$$h = \min\{a, b/M\} \quad \text{and} \quad M = \max_{\mathbf{v} \in R} \{|F_1(\mathbf{v})|, |F_2(\mathbf{v})|, \dots, |F_n(\mathbf{v})|\}.$$

Any n -th order ODE can be rewritten as a system of n first order ODEs. Given an n -th order ODE

$$y^{(n)} = F(t, y, y', \dots, y^{(n-1)}),$$

setting $z_1 = y, z_2 = y', \dots, z_n = y^{(n-1)}$, we obtain the system

$$\begin{cases} z'_1 = z_2 \\ z'_2 = z_3 \\ \vdots \\ z'_{n-1} = z_n \\ z'_n = F(t, z_1, z_2, \dots, z_n) \end{cases}$$

which is a system of n first order ODEs.

Definition 2.1 (First-Order Linear System).

A system of first order ODEs is called **linear** if it can be expressed in the form

$$\mathbf{y}'(t) = \mathbf{P}(t)\mathbf{y}(t) + \mathbf{g}(t) \quad \text{for } t \in I, \quad (2)$$

where

$$\mathbf{y}(t) = \begin{pmatrix} y_1(t) \\ y_2(t) \\ \vdots \\ y_n(t) \end{pmatrix} \quad \mathbf{g}(t) = \begin{pmatrix} g_1(t) \\ g_2(t) \\ \vdots \\ g_n(t) \end{pmatrix} \quad \mathbf{P}(t) = \begin{pmatrix} p_{11}(t) & p_{12}(t) & \cdots & p_{1n}(t) \\ p_{21}(t) & p_{22}(t) & \cdots & p_{2n}(t) \\ \vdots & \vdots & \ddots & \vdots \\ p_{n1}(t) & p_{n2}(t) & \cdots & p_{nn}(t) \end{pmatrix}$$

Definition 2.2 (Homogeneous First-Order Linear System).

A first order linear system is called **homogeneous** if $\mathbf{g}(t) = \mathbf{0}$ for all $t \in I$, i.e., it can be expressed as

$$\mathbf{y}'(t) = \mathbf{P}(t)\mathbf{y}(t) \quad \text{for } t \in I.$$

Theorem 2.2 (Existence and Uniqueness for First-Order Linear Systems).

For the first-order linear system (2), if all entries of $\mathbf{P}(t)$ and $\mathbf{g}(t)$ are continuous on an interval I , then for any $t_0 \in I$ and $\mathbf{y}_0 \in \mathbb{R}^n$, there exists a unique solution $\mathbf{y}(t)$ to the IVP

$$\begin{cases} \mathbf{y}'(t) = \mathbf{P}(t)\mathbf{y}(t) + \mathbf{g}(t) \\ \mathbf{y}(t_0) = \mathbf{y}_0 \end{cases} \quad \text{for } t \in I.$$
