

# First Order ODEs

The **general form** of a first order ODE is

$$\frac{dy}{dt} = f(t, y)$$

for some given function  $f$ .

## 1 Linear

The **general form** of a first order linear ODE is

$$\frac{dy}{dt} + p(t) \cdot y = q(t)$$

for some given functions  $p$  and  $q$ .

### 1.1 Method of Integrating Factors

For ODEs of the form

$$\frac{dy}{dt} + p(t) \cdot y = q(t)$$

the **general solution** is

$$y = \frac{1}{\mu(t)} \int \mu(t) \cdot q(t) dt$$

where the **integrating factor** is any  $\mu(t)$  that satisfies

$$\ln |\mu(t)| = \int p(t) dt$$

*Remark.* Indefinite integrals yield a family of functions differing by a constant. Each indefinite integral results in an independent constant, which represents a degree of freedom. However, the constant from  $\mu(t)$  cancels out in the final solution for  $y$ .

### 1.2 Variation of Parameters

For ODEs of the form

$$\frac{dy}{dt} + p(t) \cdot y = q(t)$$

let  $h(t)$  be a function such that

$$h(t) = \int p(t) dt$$

Then the **general solution** is given by

$$y = e^{-h(t)} \int q(t) \cdot e^{h(t)} dt$$

### 1.3

For ODEs of the form

$$\frac{dy}{dt} + p(t) \cdot y = q(t)$$

the **general solution** is given by

$$y = v \int \frac{q(t)}{v} dt$$

where  $v$  satisfies

$$\frac{dv}{dt} + p(t) \cdot v = 0$$

**Proof.**

We want to solve eq. (1). Suppose  $v$  satisfies eq. (2), which is separable and can be solved easily.

$$y' + p(t) \cdot y = q(t) \quad (1)$$

$$v' + p(t) \cdot v = 0 \quad (2)$$

Take the derivative of  $y/v$ :

$$\begin{aligned} \frac{d}{dt} \left( \frac{y}{v} \right) &= \frac{y'v - v'y}{v^2} \\ &= \frac{y'v + (p(t) \cdot v)y}{v^2} && \text{Plug in eq. (2).} \\ &= \frac{q(t)}{v} && \text{Plug in eq. (1).} \end{aligned}$$

Thus we have

$$\frac{y}{v} = \int \frac{q(t)}{v} dt$$

Since  $v$  can be solved from eq. (2), we obtain the solution for  $y$ . □

## 2 Non-Linear

### 2.1 Separable Equations

A first order ODE is **separable** if it can be written in the form

$$M(t) + N(y) \cdot \frac{dy}{dt} = 0$$

for some functions  $M$  and  $N$ . Then the solution satisfies

$$\int N(y) dy = - \int M(t) dt$$

### 2.2 Transformation Methods

Some complicated non-linear ODEs can be transformed into ODEs that are solvable by suitable substitutions.

#### 2.2.1 Bernoulli Equations

Bernoulli equations can be transformed into linear ODEs by the substitution  $v = y^{1-r}$ .

**Definition 2.1** (Bernoulli Equations).

A first order ODE is called a **Bernoulli equation** if it can be written in the form

$$\frac{dy}{dt} + p(t) \cdot y = q(t) \cdot y^r \quad (3)$$

for some given functions  $p, q$  and a real number  $r \in \mathbb{R} \setminus \{0, 1\}$ .

The **general solution** of a Bernoulli equation (3) is given by

$$y^{1-r} = \frac{1-r}{\mu(t)} \int \mu(t) \cdot q(t) dt$$

where  $\mu(t)$  satisfies

$$\ln |\mu(t)| = (1-r) \int p(t) dt$$

Note: If  $r > 0$ , then  $y = 0$  is also a solution, which is not captured by the above formula.

**Proof.**

Substitute  $v = y^{1-r}$ , and then solve with the method of integrating factors.

$$\begin{aligned} \frac{dy}{dt} + p(t) \cdot y &= q(t) \cdot y^r &\implies & y^{-r} \frac{dy}{dt} + p(t) \cdot y^{1-r} = q(t) \quad \text{for } y \neq 0 \\ &&\implies & \frac{d}{dt}(y^{1-r}) + (1-r)p(t) \cdot y^{1-r} = (1-r)q(t) \end{aligned}$$

□

### 2.2.2 Homogeneous Equations

Homogeneous equations can be transformed into separable equations.

If a first-order ODE can be expressed in the following form, then it is said to be **homogeneous**:

$$\frac{dy}{dt} = F(y/t)$$

for some given function  $F$ .

Then it can be transformed into a separable equation using  $v = y/t$ :

$$\frac{1}{F(v) - v} dv = \frac{1}{t} dt$$

*Remark.* The homogeneous equations considered here have nothing to do with the homogeneous LCCDEs.

### 2.3 Exact Equations

**Definition 2.2** (Exact Equations).

A first order ODE  $M(t, y) dt + N(t, y) dy = 0$  is said to be **exact** if there exists a function  $\Psi(t, y)$  such that

$$\frac{\partial \Psi(t, y)}{\partial t} = M(t, y) \quad \text{and} \quad \frac{\partial \Psi(t, y)}{\partial y} = N(t, y)$$

Then the general solution is given implicitly as

$$\Psi(t, y) = C \quad \text{for some constant } C \in \mathbb{R}$$

**Theorem 2.1.**

Let  $R$  be a simply connected region in the  $ty$ -plane. If  $M(t, y)$ ,  $N(t, y)$ ,  $M_y(t, y)$ , and  $N_t(t, y)$  are continuous in  $R$ , then

$$M(t, y) + N(t, y) \frac{dy}{dt} = 0 \text{ is exact in } R \quad \iff \quad M_y(t, y) = N_t(t, y) \quad \text{for all } (t, y) \in R$$

where  $M_y(t, y) := \partial M(t, y) / \partial y$  and  $N_t(t, y) := \partial N(t, y) / \partial t$ .

To solve the first order ODE  $M(t, y) dt + N(t, y) dy = 0$ , we can follow these steps:

1. Verify that the equation is exact by checking if  $M_y(t, y) = N_t(t, y)$ .
2. Integrate  $M(t, y)$  with respect to  $t$  to find  $\Psi(t, y)$ :

$$\Psi(t, y) = \int M(t, y) dt + h(y)$$

where  $h(y)$  is an arbitrary function of  $y$ .

3. Differentiate  $\Psi(t, y)$  with respect to  $y$  and set it equal to  $N(t, y)$ :

$$\frac{\partial \Psi(t, y)}{\partial y} = N(t, y)$$

This will allow us to solve for  $h(y)$ .

4. Substitute  $h(y)$  back into  $\Psi(t, y)$  to obtain the implicit solution:

$$\Psi(t, y) = C$$

for some constant  $C$ .

## 2.4 Exact Equations and Integrating Factors

It is sometimes possible to convert an ODE that is not exact into an exact equation with a suitable integrating factor.

Suppose the following first order ODE is exact:

$$\mu M(t, y) + \mu N(t, y) \frac{dy}{dt} = 0$$

Then the integrating factor  $\mu$  must satisfy

$$\frac{\partial(\mu M)}{\partial y} = \frac{\partial(\mu N)}{\partial t}$$

On one hand, assuming that  $\mu = \mu(t)$ , we have

$$\frac{d\mu}{dt} = \frac{M_y - N_t}{N} \cdot \mu$$

If  $(M_y - N_t)/N$  depends on  $t$  alone, then we can solve for  $\mu(t)$ .

On the other hand, assuming that  $\mu = \mu(y)$ , we have

$$\frac{d\mu}{dy} = \frac{N_t - M_y}{M} \cdot \mu$$

If  $(N_t - M_y)/M$  depends on  $y$  alone, then we can solve for  $\mu(y)$ .

If neither case applies, then try some substitutions to transform the ODE into a solvable form.
